

Superior water quality. Because your research depends on it.

You can concentrate on your research when you leave water quality to the Aquaneering Zebrafish System. Our unique four-stage filtration process delivers undetectable levels of ammonia and nitrites for the cleanest recirculated water in the industry. The fluidized bed biofilter design provides over 4000 square feet of surface area for biological conversion—10 times the industry standard. Baffles on the self-cleaning tank force water along the V-bottom design,

which channels waste to the rear of the tank, carrying solids up and out the overflow port. Our comprehensive expertise designing custom filtration systems and our exemplary service, including liberal warranties, service calls and planning assistance, ensures the integrity of zebrafish research of every stripe.
